

CS5610 - Project 1

Sania Anwar

Personal Homepage - Design Document

PROJECT DESCRIPTION:

This project uses vanilla HTML5, CSS3 and ES6+ for creating a personal homepage which has three pages. Two of the pages are done by me and one is with the help of GEN-AI which is described in the README. In my project, I created a homepage which includes information about me and my education. The second page is a display of my four most recent projects with detailed information about each one. The third page is about my hobby of photography which is interactive (AI-assisted). I used Bootstrap for the layout and everything is deployed on Github Pages.

PERSONAS:

The different types of visitors to this page may be recruiters, professors, and other students. Recruiters may look at this page to get to know me further and learn about what projects I have done. Students may like looking at this to know more about me and my hobbies to see if we have similar interests.

Persona 1: Vineesh (Recruiter)

Vineesh wants to find an intern for his company. He wants to be able to see everything in one place and be able to contact me if needed. He hates messy pages where there's way too much to read.

Persona 2: Ananya (Classmate)

Ananya wants to find a teammate for the next project. She wants to work with someone who has similar interests as her so that they get along well and successfully finish the project.

Persona 3: Meghanath (Professor)

Meghanath is a professor grading my homepage as an assignment. He wants to see that all the links are working properly and everything looks good overall. He doesn't like broken links and confusing layouts.

USER STORIES:

User 1: Vineesh (Recruiter)

As a recruiter, I want to see everything related to Sania's background, her projects and how to contact her so that I can get in touch immediately.

- When the recruiter first opens my website, they see my picture and a small summary/my education which helps them know who I am immediately. When they click on the projects, they can see exactly what I did and how I did it. If they like everything, then the home page has all the links needed to contact me.

User 2: Ananya (Classmate)

As a classmate, I want to get to know Sania better so that I can decide whether we could be teammates for the next project.

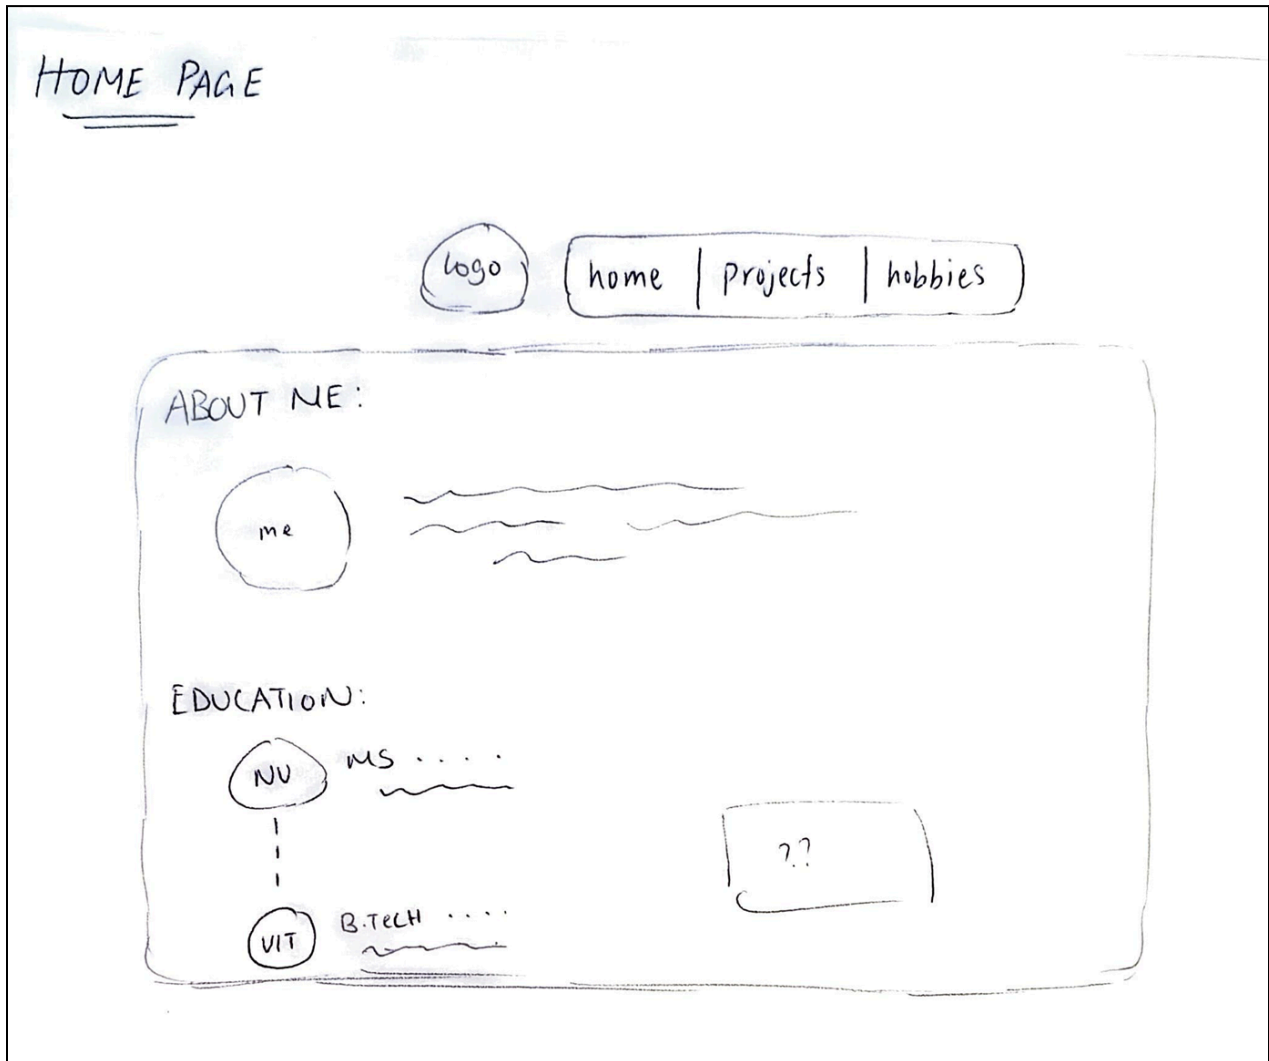

- When Ananya opens my page, she sees my picture and who I am. As she clicks through the other pages, she gets an idea of other projects I have worked on and then the hobbies page is where she sees that we both have an interest in photography. This is great since we could potentially use this as a project idea.

User 3: Meghanath (Professor)

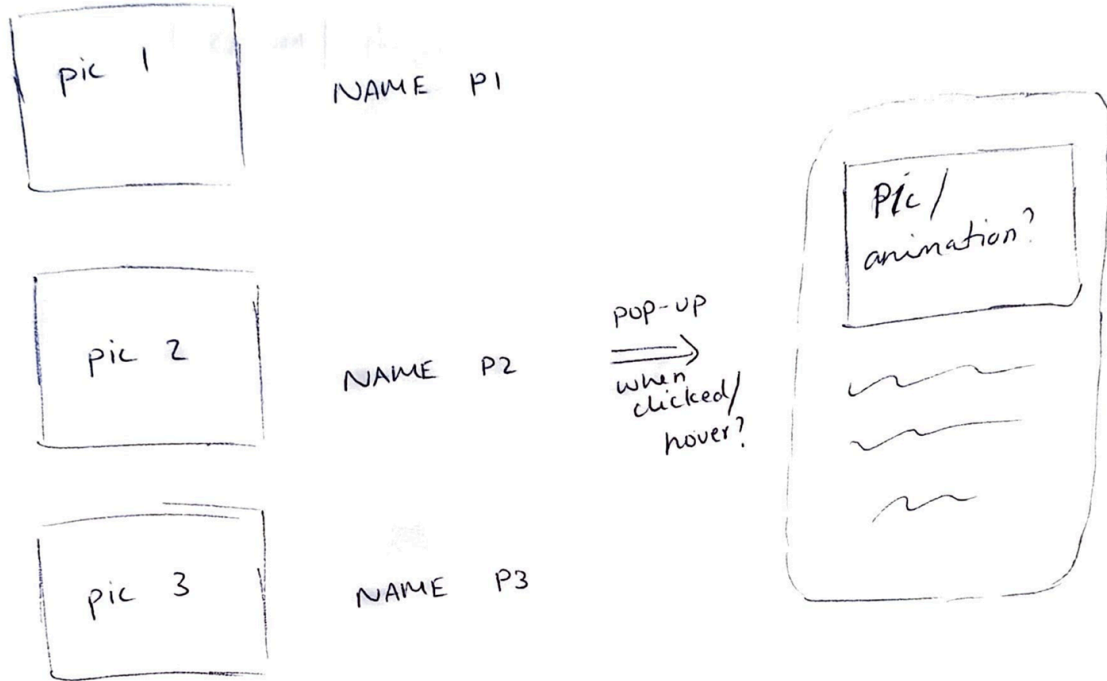

As a professor, I want to see that Sania made a creative website and everything is working properly. I want to check everything and see that it meets the rubric.

- When Meghanath opens my website from the submission form, he is able to navigate through every page using the navigation bar. The projects page opens each project in detail as it's supposed to and then the hobbies page interests him since it's very interactive.
